October 24, 2018

#### Introduction

Northern Analytical Services, LLC. (NAS) recently conducted an asbestos building material survey located at 8936 South Mackinac Trail in Sault Ste. Marie, Michigan.

### **Asbestos Background**

The United States Environmental Protection Agency (USEPA) and the State of Michigan both define asbestos containing materials (ACM) as those materials that are found to contain more than 1% asbestos (chrysotile, amosite, tremolite, chocidolite or actinolite). ACM's are classified into one of three categories which include: thermals system insulation (TSI), surfacing materials (SM), and miscellaneous materials (MM). ACM's are further divided as either friable or non-friable; friable materials are those that can be crushed, crumbled, or pulverized with hand pressure when dry.

According to the National Emissions Standards for Hazardous Air Pollutants (NESHAP, 40 CFR Part 61) friable ACM or non-friable ACM's that will likely become friable during renovation/demolition activities must be properly removed prior to the renovation/demolition activity taking place.

#### **Survey Procedures**

On October 16, 2018, Mr. Juston Rehkopf of NAS, a State of Michigan accredited Asbestos Building Inspector (A36890), visited the site and performed the survey work. The areas included in the survey were visually and physically inspected for suspect asbestos containing materials in accordance with NESHAP requirements. The attached drawings show all areas that were included in this survey. During the survey the building was divided into functional spaces (FS) that represent a particular use area or room. Each FS was surveyed for the presence of suspect ACM's (SACM).

Once identified, each SACM was assigned a unique identifying number, called a Homogeneous Material Number, and provided a written description (Homogeneous Material Description). Each Homogeneous Material was then categorized as thermal, surfacing, or miscellaneous; then quantified and classified as either friable or non-friable. Please keep in mind that materials classified as non-friable at the time of the survey may become friable overtime or during renovation activities; vinyl sheet flooring, plaster, and drywall are all examples of non-friable materials that will likely become friable during demolition.

Identified SACM's were then either sampled for the presence of asbestos or assumed to contain asbestos. During this survey all SACM's identified were tested for asbestos content.

Samples from each suspect material were collected in random locations. A unique Sample No. was assigned to each sample collected to link it to the corresponding material. Sample numbers begin with the materials Homogeneous Material No., and then two figures starting with 01 were added to the end. For example, sample number 101 was collected from material number 1. If additional samples were collected from the same material, sample numbers increased consecutively, therefore sample numbers 101, 102, 103 would all be from Material No. 1

Lake Superior Academy Asbestos Building Survey Report

Project No.: 180326 October 24, 2018

The number of samples collected from each material was determined by regulatory requirements and the Inspector's findings. Regulatory requirements for each of the three material classifications are as follows:

- Friable Surfacing Materials require either 3, 5, or 7 samples depending on the amount of material present. (3 for <1,000 sq.ft., 5 for 1,000 to 5,000 sq.ft., and 7 for >5,000 sq.ft.)
- Thermal system insulation requires a minimum of 3 samples
- Miscellaneous and non-friable materials require a minimum of 1 sample.

Once collected, samples were properly packaged and shipped via Federal Express to an independent, properly accredited laboratory for analysis. Analytical results have been included at the end of the Survey Report Section for each building.

A description of each of the suspect materials identified during this survey is attached to this report in a section titled Homogenous Materials Report. Also attached are sections titled Survey Report and Sample Location Report. The Inspection Report will show what suspect materials were found and the Sample Location report will describe where bulk samples were collected.

Prior to disturbing any of the materials found in these buildings, one should carefully match each building material that is going to be disturbed with the materials listed in this report, should a material be discovered that is not clearly identified in this report, that material should be assumed to contain asbestos until testing can be performed. Materials not accurately described in this report have not been tested for asbestos and should be treated as asbestos containing until testing can prove otherwise.

The materials that are either known or assumed to contain asbestos should not be disturbed except by an accredited abatement contractor during the removal process. A copy of this report should be given to anyone whose job may require them to disturb suspect asbestos containing materials to ensure materials are not inadvertently disturbed. Along with a copy of this report, any individual whose job may require them to work around ACM should be provided at least two hours of asbestos awareness training annually. Training should be site specific and include an understanding of this report.

#### **Other Potentially Hazardous Materials**

Florescent light bulbs and associated ballasts should be treated as hazardous materials and be properly disposed of. Light bulbs likely contain mercury vapor and should be removed and sent to a recycler undamaged. Ballasts should be treated as PCB containing unless specifically labeled by the manufacture as not containing PCB's. All PCB ballasts should be contained in metal type drums and delivered to an approved recycler in accordance with all local, State and Federal regulations.

All painted or coated surfaces should be assumed to contain lead or cadmium unless testing proves otherwise. Anyone who works in this building and who may encounter lead or cadmium coated surfaces should receive at least two hours of lead/cadmium awareness training.

Lake Superior Academy Asbestos Building Survey Report Project No.: 180326

October 24, 2018

### **Findings**

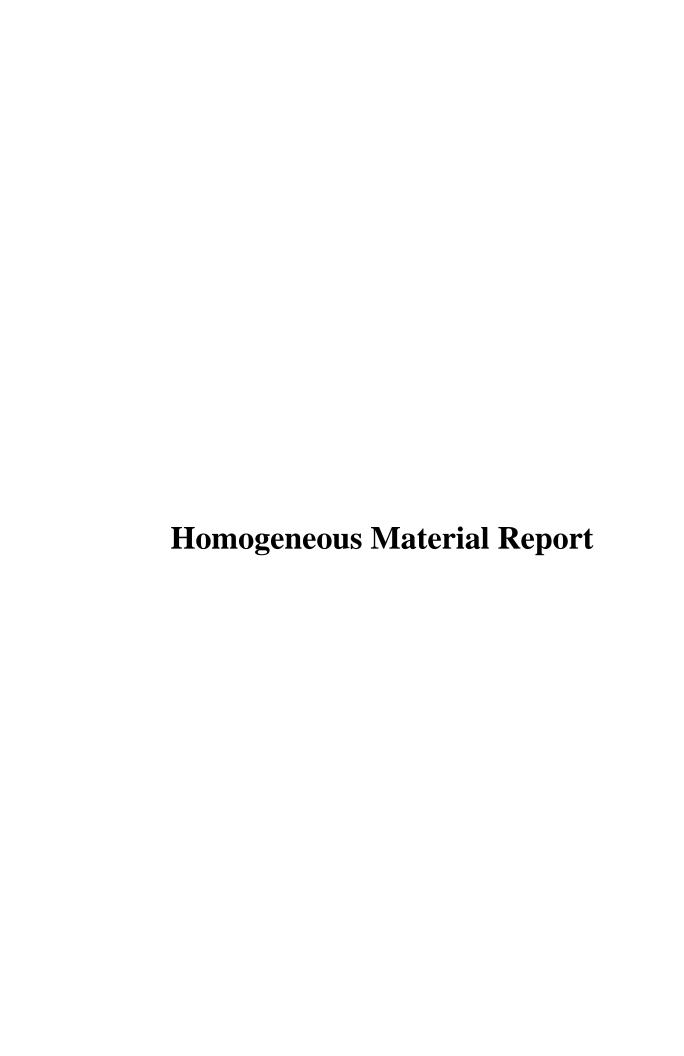

Of the thirteen suspect asbestos containing materials identified during our survey, none were found through laboratory testing to contain asbestos.

See the attached Materials Report for additional information regarding each of the materials identified.

### Recommendations

Based on the findings of the Inspector, the following recommendations have been made:

• Contact Northern Analytical Services, LLC. immediately if a material that is not described in this report is discovered. Treat newly discovered materials as presumed asbestos containing materials until testing can be performed.

Dear Ken Conlin,

We at SanAir would like to thank you for the work you recently submitted. The 16 sample(s) were received on Thursday, October 18, 2018 via FedEx. The final report(s) is enclosed for the following sample(s): 101, 201, 301, 302, 303, 401, 601, 701, 801, 901, 1001, 1201, 1301, 1302, 1303, 1601.

These results only pertain to this job and should not be used in the interpretation of any other job. This report is only complete in its entirety. Refer to the listing below of the pages included in a complete final report.

Sincerely,

Sandra Sobrino

Asbestos & Materials Laboratory Manager

andra Sobiino

#### **Disclaimer**

The final report cannot be reproduced, except in full, without written authorization from SanAir. Fibers smaller than 5 microns cannot be seen with this method due to scope limitations. The accuracy of the results is dependent upon the client's sampling procedure and information provided to the laboratory by the client. SanAir assumes no responsibility for the sampling procedure and will provide evaluation reports based solely on the sample and information provided by the client. This report may not be used by the client to claim product endorsement by NVLAP or any other agency of the U.S. government. Samples are held for a period of 60 days.

For NY state samples, method EPA 600/M4-82-020 is performed.

Polarized- light microscopy is not consistently reliable in detecting asbestos in floor covering and similar non-friable organically bound materials. Quantitative transmission electron microscopy is currently the only method that can be used to determine if this material can be considered or treated as non-asbestos containing.
